

TICHI APPLICATION

Bug Report

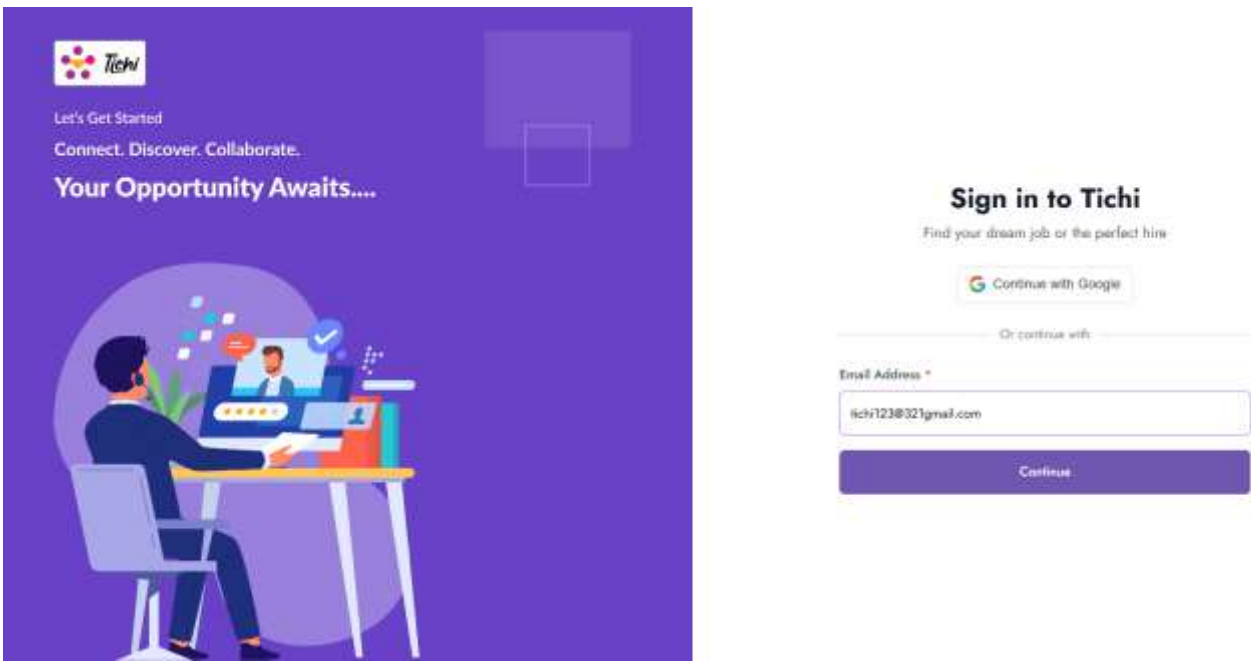

Prepared by Praveen kumar P | 04-Jul-2026 | 2 defects logged

Summary

Defect ID	Title	Severity	Priority	Status
BUG_LOGIN_001	Login is allowed even when the email entered is not in a valid format.	High	High	New / Open
BUG_LOGIN_016	Login fails with a server error even when the email and password entered are correct.	Critical	High	New / Open

BUG_LOGIN_001 — Login is allowed even when the email entered is not in a valid format.

DEFECT SUMMARY	
Defect ID	BUG_LOGIN_016
Project Name	Tichi
Module / Page	Login Page
Reported By	Praveen kumar P
Reported Date	04-Jul-2026
Application URL	https://tichi-app-webapp-stage.web.app/
Environment	Staging (Web Application)
Browser / Platform	Google Chrome (Latest) / Windows
Build / Version	Staging build, checked on 04-Jul-2026
Related Test Case ID	As per assignment (Task 2) — not reproducible in current build, see notes
DEFECT TITLE	
Login is allowed even when the email entered is not in a valid format.	
SEVERITY / PRIORITY / STATUS	
Severity	High
Priority	High
Status	New / Open
Defect Type	Functional — Input Validation
DESCRIPTION	
The Login page accepts an invalid email format (e.g., "abc") without showing a validation error. The application allows the login request to proceed instead of blocking it. Users should not be able to continue with an incorrectly formatted email address. The system should display a validation message such as "Please enter a valid email address.".	
PRE-CONDITIONS	
1. Login page is open at https://tichi-app-webapp-stage.web.app/	
STEPS TO REPRODUCE	
1. Go to the Login page. 2. Type an invalid email value into the Email field, e.g. "abc" or "test@" or "testcom". 3. Enter any password. 4. Click Login. 5. Check whether the app blocks the request and shows a validation message.	
TEST DATA	
Email	abc (not a valid email format)

Password	Any password
EXPECTED RESULT	
The app should stop the login and show something like "Please enter a valid email address" when the email format is wrong.	
ACTUAL RESULT	
See notes below — this could not be reproduced against the current build.	
IMPACT / RISK	
If this does slip through, it means bad data can reach the backend and the login form isn't doing basic sanity checks on the email — worth double-checking on every deploy.	
ATTACHMENTS	
 BUG_LOGIN_016	
ADDITIONAL NOTES	
This defect was raised as instructed by the assignment brief. In the latest round of testing (TC_LOGIN_004), entering "abc" in the email field did trigger a proper email validation message, and the test case is currently passing. Keeping this in the report as required, but flagging that it isn't reproducible on the current build — worth re-checking on the actual staging environment before treating it as an open bug.	

BUG_LOGIN_001 — Login fails with a server error even when the email and password entered are correct.

DEFECT SUMMARY	
Defect ID	BUG_LOGIN_001
Project Name	Tichi
Module / Page	Login Page
Reported By	Praveen kumar P
Reported Date	04-Jul-2026
Application URL	https://tichi-app-webapp-stage.web.app/
Environment	Staging (Web Application)
Browser / Platform	Google Chrome (Latest) / Windows
Build / Version	Staging build, checked on 04-Jul-2026
Related Test Case ID	TC_LOGIN_001
DEFECT TITLE	
Login fails with a server error even when the email and password entered are correct.	
SEVERITY / PRIORITY / STATUS	
Severity	Critical
Priority	High
Status	New / Open
Defect Type	Functional — Server Error
DESCRIPTION	
Logging in with a correct, registered email and the right password should just work. Instead, the request comes back as a server error and the user isn't logged in at all. Since the credentials themselves aren't the problem here, this looks like something breaking between the frontend and the backend on the login call itself, not a validation issue.	
PRE-CONDITIONS	
1. A registered account exists with a known, correct email and password. 2. Login page is open at https://tichi-app-webapp-stage.web.app/	
STEPS TO REPRODUCE	
1. Go to the Login page. 2. Enter a valid, registered email address. 3. Enter the correct password. 4. Click Login. 5. Watch what happens — check the browser console/network tab if possible.	
TEST DATA	

Email	Valid, registered email
Password	Correct password

EXPECTED RESULT

User logs in successfully and lands on the home/dashboard page.

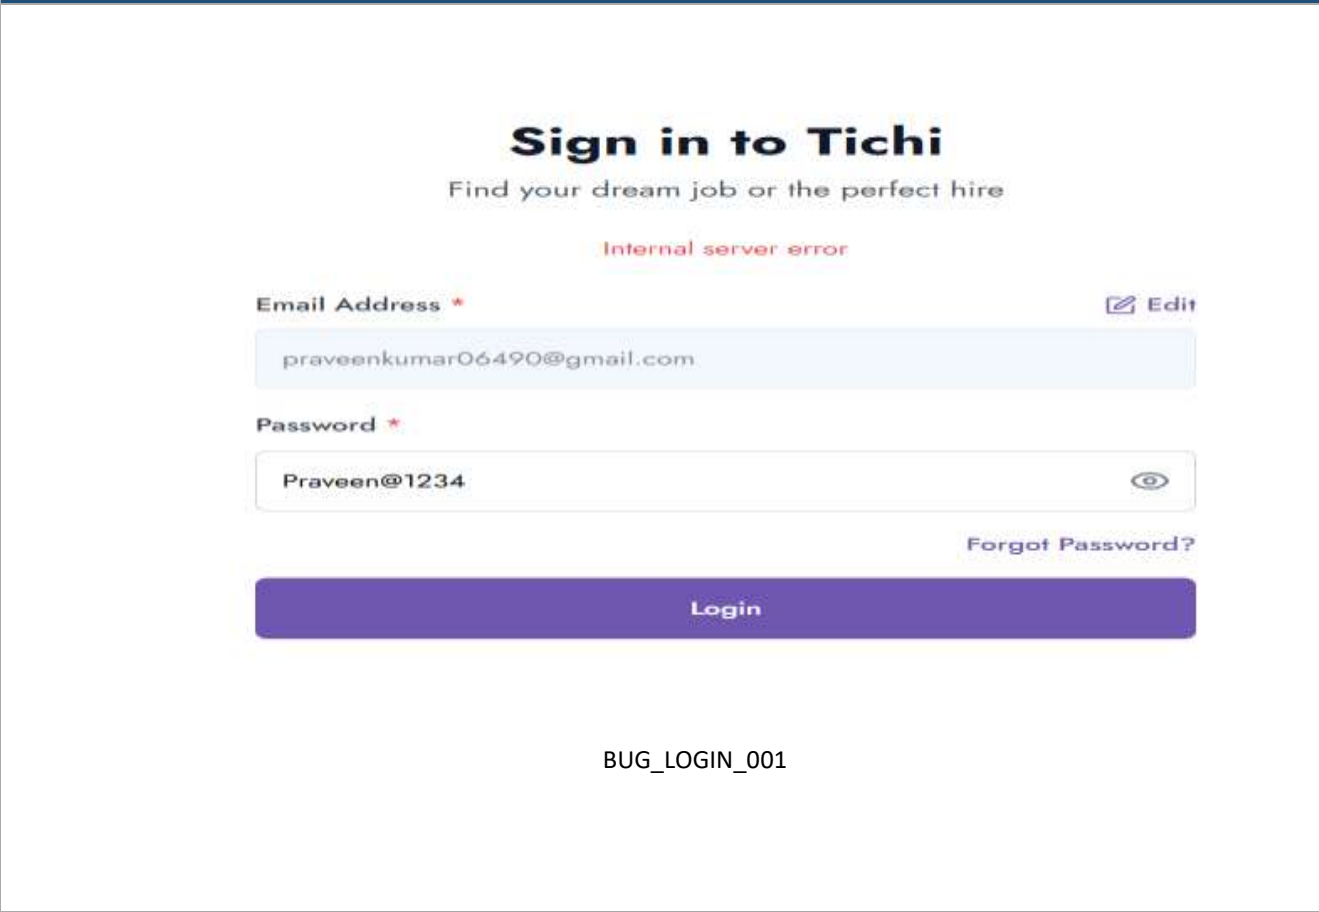

ACTUAL RESULT

Login fails with a server error. The user stays on the login page and isn't signed in, even though everything entered was correct.

IMPACT / RISK

This blocks users from getting into the app at all — it's about as bad as a login bug gets. Needs backend log investigation to find the actual exception behind the server error.

ATTACHMENTS

ADDITIONAL NOTES

Reported in TC_LOGIN_001 as: "User was not logged in and it has been server error." Recommend checking server-side logs around the login endpoint to find the root cause.

BUG_LOGIN_003 — A newly reset password stops working after a short while, forcing the user to reset it again.

DEFECT SUMMARY	
Defect ID	BUG_LOGIN_003
Project Name	Tichi
Module / Page	Login Page / Password Reset
Reported By	Praveen kumar P
Reported Date	04-Jul-2026
Application URL	https://tichi-app-webapp-stage.web.app/
Environment	Staging (Web Application)
Browser / Platform	Google Chrome (Latest) / Windows
Build / Version	Staging build, checked on 04-Jul-2026
Related Test Case ID	TC_LOGIN_012, TC_LOGIN_013
DEFECT TITLE	
A newly reset password stops working after a short while, forcing the user to reset it again.	
SEVERITY / PRIORITY / STATUS	
Severity	Critical
Priority	High
Status	New / Open
Defect Type	Functional — Session / Authentication
DESCRIPTION	
After resetting a password, the user can log in fine right away with the new password. But that password doesn't seem to stick — if you wait a bit, or just close the browser and come back, the same "new" password no longer works and the user is forced to reset it all over again. This happened in two separate test runs: one where the tester simply waited before logging in again, and one where the tester closed the browser and reopened it. Both times the previously working password stopped being accepted.	
PRE-CONDITIONS	
1. A registered account exists. 2. The user is able to trigger a password reset for that account.	
STEPS TO REPRODUCE	
1. Reset the account password to a new value. 2. Log in immediately using the new password — this works. 3. Either wait some time, or close and reopen the browser. 4. Try logging in again using the same new password.	
TEST DATA	

Email	Valid, registered email
Password	Newly reset password
EXPECTED RESULT	
The new password should keep working normally until the user changes it again — no reason it should stop working just from time passing or the browser being closed.	
ACTUAL RESULT	
The new password is rejected after some time has passed, or after closing and reopening the browser. The user has to reset the password again just to get back in.	
IMPACT / RISK	
This makes password resets effectively useless — the fix doesn't last. Likely candidates: session/credential caching issue, or the new password isn't being saved/persisted correctly on the backend.	
ATTACHMENTS	
Screenshot / screen recording to be attached here (not included in this template).	
ADDITIONAL NOTES	
TC_LOGIN_012 covers the "wait some time" case, TC_LOGIN_013 covers the "close and reopen browser" case — same root symptom in both, so grouped here as one defect.	

BUG_LOGIN_004 — Login succeeds with an email that doesn't exactly match the registered account.

DEFECT SUMMARY	
Defect ID	BUG_LOGIN_004
Project Name	Tichi
Module / Page	Login Page
Reported By	Praveen kumar P
Reported Date	04-Jul-2026
Application URL	https://tichi-app-webapp-stage.web.app/
Environment	Staging (Web Application)
Browser / Platform	Google Chrome (Latest) / Windows
Build / Version	Staging build, checked on 04-Jul-2026
Related Test Case ID	TC_LOGIN_014
DEFECT TITLE	
Login succeeds with an email that doesn't exactly match the registered account.	
SEVERITY / PRIORITY / STATUS	
Severity	Critical
Priority	High
Status	New / Open
Defect Type	Functional — Security / Authentication
DESCRIPTION	
The login should only work if the email typed in matches a registered account exactly. Instead, entering an email that's close to — but not the same as — a registered address still let the tester log in. That's a real problem, because it suggests the email check on login isn't strict.	
PRE-CONDITIONS	
1. A registered account exists with a known, exact email address.	
STEPS TO REPRODUCE	
1. Go to the Login page. 2. Enter an email that's similar to a registered one but not an exact match, e.g. "user12@3gmail.com". 3. Enter a password. 4. Click Continue/Login.	
TEST DATA	
Email	user12@3gmail.com (not an exact match to the registered email)
Password	Any password used in the attempt

EXPECTED RESULT

Login should be rejected with something like "Invalid email or password" since there's no exact match.

ACTUAL RESULT

The user was logged in successfully despite the email not matching the registered account exactly.

IMPACT / RISK

This is a serious security issue — if the login check isn't doing an exact match, unauthorized accounts could be accessed. Needs urgent investigation into the credential-matching logic.

ATTACHMENTS

Screenshot / screen recording to be attached here (not included in this template).

ADDITIONAL NOTES

Recommend prioritizing this defect given the security implications, and re-testing with several near-match email variations to understand the scope of the matching bug.
